Hi All,

## WELCOME TO THE NEW YEAR

We have a year that is going to be full of new issues with AI being added into everything we touch and the need to understand the impacts and just what we can control especially out data being exposed as we use it.

Fred has done a lot of work with presentation on Linux and what it is. This year we will get into the hands on in the workshop sessions, so you can be comfortable of making the swap away from Windows / Microsoft if you wish.

It is easy to say make the change but Linux throws up the little unknowns and hopefully, the workshop can see us moving along on the journey.

I was trying to install on an old Acer with low specifications and no way could I get Ubuntu Mate up. Made numerous BIOS changes but could not crack it. Strangely I reached a full install but when I put in the pass word it went to a blank screen, even stranger is that if I changed to a guest login it open up OK but in guest no changes are saved.

I swapped disks to one that had Mint on it and it worked. Changed back to the hard drive and then installed Mint and it installed and opened OK. Such is life.

A reminder your renewal of membership for 2026 is now due. We have a few members yet to make the payment to renew.

## Q&A - December meeting

### MBB Modem

#### Unlock from original Service Provider

To unlock your mobile modem/phone from a service provider, you typically need to contact your current carrier and request a unlock. They will provide you with instructions, which may include entering an unlock code or completing a software update, and the process can take a few days to complete.

In this case the service provider determined that the device was eligible for unlocking.

The unlocking code was provided, but no way was obvious to enter said code.

Sadly no information was provided as to the unlock process.

After several attempts to enter the code, the penny dropped.

It was necessary to log into the modem utilising the web browser to access the appropriate screen to locate the entry slot in the displayed page.

How do I unlock my phone from the Telstra network using IMEI?

<https://www.telstra.com.au/support/mobiles-devices/unlock-phone-imei>

A web search with 'unlock mobile device from service provider' will provide a list of ways' including paid services which are not necessary.

### MBB Modem Running Warm

The modem is running in the No Battery mode and is using the Charger as the power supply.

It is normal for the device to run warm, not hot, if constantly on.

The temperature is determined by how hard the modem is working to maintain connection to the cellular network and the WiFi connections and the air temperature.

It is prudent to ensure that adequate air space/circulation is available.

### E-mail Client

#### Setting up Service provider Parameters

There are a number of e-mail services to set up.

The information was available in a number of formats.

Each provided an explanation of POP3, SMTP and IMAP.

One was excellent in providing the data in a clear table for each mode.

The other two, unhelpfully, had the data buried in explanation text, so it had to be winkle out.

### Can't open PDF in Adobe Reader

Surprise! Libre Office Draw opened it O.K.

Some PDFs can be opened with a web Browser.

PDFs can have various security settings applied/:- Password required to open, Text cannot be copied out, etc.

### Great PDF Tools

### Mental Note on a Piece of Paper

If something is written Remembrance is Enhanced.

Even though the note is not available the content may be remembered.

If the same content is typed it is no way as beneficial.

**AI IN 2026: WHAT IT ACTUALLY MEANS FOR REGULAR PEOPLE AT HOME** – If you've felt like the word "AI" is following you around, you're not wrong. It's in the news, your apps, your car, your TV, and probably somewhere in your toaster's marketing copy.

But what does AI in 2026 really mean for a normal person at home? Not a programmer, not a Silicon Valley founder. Just someone with a PC, a phone, a TV, and a low tolerance for nonsense.

Short answer: AI is going to be built into almost everything you use.

Some of it will be genuinely helpful.

Some of it will be annoying.

All of it will come with strings attached.

**[Setting Up Ransomware Protection in Windows 11 – A Simple and Complete Guide](#)**  
By Dellenny • by John Edward

Ransomware is one of the most dangerous types of malware people face today. It locks your files and demands payment to release them. Many users think ransomware only affects businesses, but home computers are just as much at risk. Cyber-criminals often spread ransomware through websites, email attachments, or fake downloads. If your computer is not protected, you could lose

important photos, documents, and personal information in seconds. Thankfully, Windows 11 includes powerful ransomware protection features built right into the system. You do not need expensive paid antivirus tools to stay safe—Microsoft provides strong protection that only needs a little setup. In this guide, we explain step-by-step how to turn on ransomware protection in Windows 11, what features are included, and some extra tips to keep your files safe.

### What is Ransomware?

Before we set up protection, it helps to understand what ransomware is. Ransomware is a type of malware that:

- Infects your computer
- Locks or encrypts your files
- Shows a message asking for money (a ransom)
- Threatens to delete your files if you do not pay. Even if someone pays, there is no guarantee they will get their files back. That is why prevention is always better than trying to recover after an attack.

Windows 11 has a built-in feature called Ransomware Protection, located inside Windows Security, to protect your important files before something goes wrong.

### Built-In Ransomware Protection in Windows 11

Windows 11 includes several layers of security. The main tool for ransomware defense is:

#### Controlled Folder Access

This tool stops suspicious apps from changing your protected files. If a strange app tries to access files in protected folders, Windows blocks it immediately and shows a warning. Even if ransomware slips past other security tools, Controlled Folder Access can stop it from locking your files.

### How to Turn On Ransomware Protection in Windows 11

Now let's go through the steps to enable it:

#### Step 1 – Open Windows Security

1. Click the Start button
2. Type Windows Security

3. Click the app to open it

#### Step 2 – Open Virus & Threat Protection

Inside Windows Security, click Virus & threat protection. This section controls malware defenses and scanning tools.

#### Step 3 – Find Ransomware Protection

Scroll down the page until you see Ransomware protection. Click the link to open it.

#### Step 4 – Enable Controlled Folder Access

You will now see the main ransomware settings page. Find Controlled folder access and turn the toggle On. Windows may ask for permission from an administrator—click Yes to confirm.

Once activated, this feature starts protecting your files immediately.

#### Customizing Ransomware Protection Settings

##### 1. Add More Folders to Protect

Windows automatically protects important system folders, such as:

- Documents
- Pictures
- Videos
- Music

However, you may have files stored in other folders—for example, on the desktop or in a custom project folder. To protect them:

1. Under Controlled Folder Access, click **Protected folders**
2. Click **Add a protected folder**
3. Browse and choose the folder you want to secure

Now ransomware cannot modify files inside that folder without your permission.

##### 2. Allow Apps You Trust

Sometimes Windows may block a safe app that needs access to your folders.

For example, video editing or backup apps might need permission. If that happens:

1. Go back to the Controlled Folder Access settings
2. Click Allow an app through Controlled folder access
3. Choose the app you trust. This keeps protection active while letting your programs work normally.

### Turn On Cloud-Based Protection

Windows Security also includes cloud-based protection and real-time scanning. These help Microsoft detect new malware threats faster.

To check if they are on:

1. Open Windows Security
2. Click Virus & threat protection
3. Click Manage settings under Virus & threat protection settings. Make sure the following are turned On:
  - Real-time protection
  - Cloud-delivered protection
  - Automatic sample submission

Together, these tools make your system much harder for ransomware to attack.

### Enable OneDrive Backup for Extra Safety

Even with strong protection, it is possible for malware to sneak through. That is why backups are important. Windows 11 works well with OneDrive, a cloud backup service that can automatically save your files online. If something goes wrong, you can restore your folders later.

To set up OneDrive backup:

1. Open Settings
2. Go to Accounts
3. Select Windows Backup
4. If OneDrive is not active, sign in and set up backup. This gives you another layer of security because even if ransomware encrypts your files, you can restore clean versions from the cloud.

### How to Stay Safe from Ransomware –

Extra Tips Windows 11 protection is strong, but your habits also matter. Follow these tips:

- Do not open email attachments from unknown senders
- Avoid unofficial download websites
- Keep apps and Windows updated
- Use a strong antivirus if available
- Do not click suspicious links
- Use a strong password or password manager

Cyber-criminals often trick users into installing ransomware without realizing it. Safe browsing habits can make a huge difference.

### What If You Get Infected Anyway?

If ransomware has infected your computer:

1. Disconnect from the internet immediately
2. Open Windows Security and run a Full scan
3. Check backups to see if your files can be restored
4. Do not pay the ransom—there is no guarantee

You can contact professional support if necessary, but having protection enabled early keeps you out of most trouble. Ransomware is a serious threat, but Windows 11 gives users effective protection tools for free. By turning on Controlled Folder Access, enabling real-time and cloud security features, and using good backup habits, you greatly reduce the risk of losing important files. The setup only takes a few minutes, but it can save you hours of stress and possibly years of memories stored on your device.

With everything working together—Windows security settings, safe browsing habit, and backup strategies—you can use your computer with confidence knowing your personal files are safe from ransomware attacks.
